- PRODUCT DATA SHEET -

Name of Product: Recombinant Human VTN-LAMA β 1 Fusion Protein
Catalog Number: hRP-1860
Manufacturer: LD Biopharma, Inc.

Introduction

Extracellular matrix (EMC) and growth factor signaling environments are part of the nature mechanism for regulating stem cell fate. These micro-environmental stimuli are processed through a veritable network of intracellular signaling pathway. Evidence to date suggests that understanding of interactions between these pathway in defined cell culture condition are critical in controlling cell fate in vitro in the development of cell based therapeutic applications. Laminins are high-molecular weight (>400kD) protein of the extracellular matrix. The laminins are an important and biologically active part of the basal lamina, influencing cell differentiation, migration and adhesion. Currently many active domain (peptide) from various laminins have been identified, which provide a opportunity for protein – engineering for its production.

To develop a specific coating matrix protein for representing human laminin γ 1, *three active peptide* (RYVVLRP GGGG YIGSR GGSS LGTIPG) domain from human laminin α 1, were joint together with small *linker* and then fusion with human vitronectin (62-398aa). As human vitronectin provides a excellent polystyrene surface binding capacity, this recombinant VTN-laminin peptide fusion might serve as a unique coating matrix for various stem cell differentiation applications in vitro.

Three peptide fusion fragment of human laminin γ 1 (26aa) was further fused to human vitronectin protein (62- 398aa) to generate a fusion protein, Named as VTN-LAMA β 1. This VTN-LAMA β 1peptide cDNA was constructed with codon optimization gene synthesis technology. This protein was expressed in E. coli as inclusion bodies. The final product was refolded using our unique “temperature shift inclusion body refolding” technology and chromatographically purified.

Gene Symbol: None (Named as VTN-LAMA β 1 by manufacture)
Accession Number: NP_000629 + (artificial synthetic protein)
Species: Based on Human protein sequence

Size: 50 µg / Vial
Composition: 1.0 mg/ml, sterile-filtered, in 20 mM pH 8.0 Tris-HCl Buffer, with proprietary formulation of NaCl, KCl, EDTA, Sucrose and DTT.
Storage: In Liquid. Keep at -80°C for long term storage. Product is stable at 4 °C for at least 30 days.

Applications

When coated at 0.5 - 1 µg/ ml per cm² and combined with chemically defined culture medium, this recombinant protein may be used as matrix protein to replace native laminin1 for benefiting different primary human cell culture in vitro.

Quality Control

Purity: > 90% by SDS-PAGE.
